

Pamó

Keep it safe.

Pamo is a save-and-earn app on Arc. People save in USDC, set goals, and their savings earn live lending yield while they sit, without ever handing over control of their money.

NETWORK	PLATFORM	CURRENCY	BUILT FOR	STATUS
Arc mainnet	Web app	USDC	Arc Microgrants	v1 in build
	Mobile app (roadmap)			

What Pamo is

Pamo turns idle USDC into savings that grow. You open a savings pot, choose how much risk you're comfortable with, and put money in. Pamo places it in a curated lending vault on Arc, where borrowers pay interest. Your balance grows over time, and you can see exactly what you've saved and what you've earned.

Some savings you want to reach any time; some you want to protect until a goal is met. Pamo supports both. Everything happens onchain in USDC: Pamo never holds your keys, and no one but you can withdraw your savings.

The name comes from the Yoruba *fi pamọ*, meaning "keep it safe."

THE PROBLEM

Most USDC sits idle, earning nothing. Earning yield onchain usually means finding vaults, reading contract addresses and learning DeFi jargon. That's too much for someone who just wants to save.

THE ANSWER

Save any amount in a few taps, set goals, compare risk in plain language, and earn live yield on Arc, with honest numbers and full control of your money.

WHO IT'S FOR

People who hold USDC, or want dollar savings, and want it to grow without being DeFi experts.

CORE USE CASE

"I have 200 USDC. I want some I can reach any time, and a 1,000 USDC goal by December, both earning while I wait."

From wallet to interest and back

Interest grows the value of your savings → you withdraw USDC plus what it earned.

Pot	One savings bucket that belongs to you. Every Anytime Vault and Goal Vault is a pot.
Tier	Calm, Steady or Bold. It decides which curated lending vault your pot's money goes into.
Lending vault	A vault on Arc that lends USDC to borrowers and earns interest. Run by a professional curator, not by Pamo.
APY	The vault's yearly rate <i>today</i> , after vault fees. Live, so it changes daily.
Earned	What your pot is worth now, minus what you put in.

In build: version 1

IN BUILD

part of v1, shipping on Arc mainnet

ROADMAP

planned after v1 (section 04)

F1 Anytime Vault

IN BUILD

Savings you can reach whenever you want. Add money any time, take out part or all of it any time, and watch it earn in between.

- Open with a tier and a first deposit; top up whenever.
- Withdrawals only ever go back to you.

F2 Goal Vault

IN BUILD

Savings with a purpose. Name your goal, set a target amount and an unlock date, and Pamo keeps the money protected until you get there.

- Unlocks when your balance reaches the target **or** the unlock date arrives, whichever comes first.
- A progress bar shows how close you are; add money any time.

F3 Pamo Portfolios: Calm · Steady · Bold

IN BUILD

Choose how much risk you're comfortable with. Each tier puts your savings into one curated USDC lending vault on Arc, compared side by side with its live rate, its curator, how much cash is available to withdraw, and its risk in plain English.

- **Calm**: lowest risk, money easy to withdraw. **Steady**: balanced. **Bold**: higher potential rate, more risk.
- These are USDC lending vaults, not stocks or funds.

F4 Growth Calculator

IN BUILD

See what your savings could grow to before you commit. Enter a starting amount, a monthly top-up and a number of months, pick a tier, and see the projected balance and growth curve at today's live rate.

- Works without a wallet. Always labelled "estimate at today's rate, not a promise."

F5 Review before you sign

IN BUILD

Every save and every withdrawal shows a clear summary before your wallet opens: the amount, where it goes, today's rate, any fees, the network fee in USDC, and any warnings, such as a vault being short on cash.

- No surprises: warnings appear before the button, not after a failure.

F6 Dashboard & pot details

IN BUILD

One screen with your total saved, what you've earned so far, and today's rate for each tier. Each pot shows its value, earnings and goal progress, with a full activity history linked to the Arc explorer.

F7 Wallet & Arc connection

IN BUILD

Connect a wallet in one step. If it's on the wrong network, Pamo offers a one-click switch to Arc and shows your USDC balance.

04 · WHAT'S NEXT

Roadmap: after version 1

These features are designed but deliberately left out of v1, so the core saving experience is solid first.

R1 Pamo AI

ROADMAP

A savings assistant. A short risk quiz suggests the right tier; a goal written in plain English ("1,000 USDC for a laptop by March") becomes a savings plan. The AI suggests, you sign. It never holds keys.

R2 Pamo Business

ROADMAP

A treasury for teams and small businesses: shared savings with roles, approvals and a cash reserve.

R3 Pamo Halal

ROADMAP

Savings for people who want to stay sharia-compliant. No interest: returns come from profit-sharing and certified halal sources, reviewed by a sharia advisory board, and kept fully separate from Pamo's lending vaults.

FEATURE	WHAT IT WOULD DO	WHY IT'S NOT IN V1	STATUS
Pamo AI	Risk quiz → tier suggestion; plain-English goal → savings plan; the AI suggests, the user signs, and the AI never holds keys	Core saving must be solid first	ROADMAP
Pamo Business	Team treasury with roles, approvals and a cash reserve	Needs a multi-user permissions design	ROADMAP
Pamo Halal	Sharia-compliant savings: no interest, profit-sharing returns from certified halal sources	v1 yield comes from interest-based lending; needs a compliant yield source and sharia board review	ROADMAP
Auto-save	Recurring monthly deposits	Needs a scheduler (keeper) to trigger the deposits	ROADMAP
Blended portfolios	Each tier spread across several vaults with rebalancing	Rebalancing logic is risky to rush	ROADMAP
Break a goal early	Withdraw a locked goal with a confirmation step	Product decision pending	ROADMAP
Crosschain deposits	Save from other chains straight into Pamo	Supported by the Earn Kit, but adds bridge fees and flows	ROADMAP
Fiat onramp	Buy USDC inside Pamo	The Onramp kit covers only some regions	ROADMAP
EURC savings	Save in euros	USDC first	ROADMAP
Gasless saving	Pamo pays the user's gas	Needs a paymaster	ROADMAP
Notifications	"Goal reached", "rate changed"	Needs a backend	ROADMAP
Mobile app	Native iOS and Android apps with all of Pamo's features	Web app first; v1 already works in phone browsers	ROADMAP
Passkey sign-in	Sign up with Face ID or a fingerprint. No wallet app, no seed phrase	Needs Circle Modular Wallets (ERC-4337) confirmed on Arc mainnet	ROADMAP
Email or social login	Sign in with email, Google or a one-time code, like any normal app	Needs Circle user-controlled wallets	ROADMAP

FEATURE	WHAT IT WOULD DO	WHY IT'S NOT IN V1	STATUS
One-tap saving	One confirmation instead of two ("Allow", then "Save")	Needs a smart wallet to batch the two steps	ROADMAP
Account recovery	Lost phone? Get the account back without a seed phrase	Comes with passkey or email sign-in	ROADMAP
Cash out to bank	Turn savings back into money in a bank account	Needs an offramp provider and differs by region	ROADMAP
Your own currency	See balances as "≈ €110" next to USDC, so the numbers feel real (savings stay in USDC)	Needs a reliable price feed	ROADMAP
Guided first save	A short walkthrough: what a pot is, what a tier means, then a first small deposit	Core flow first	ROADMAP
In-app help	Tap any term ("APY", "vault") for a one-line plain explanation	Core flow first	ROADMAP

05 · PRINCIPLES

What Pamo always does

Your money stays yours Only you can withdraw your savings. No admin, including Pamo, can move, freeze or take them.	Honest numbers Rates are live and shown as they are, even when low. Projections are always called estimates.
No surprises Every money movement is reviewed before you sign, with warnings shown first.	Plain language "Lending vault", "earned", "unlocks on". No unexplained jargon.
Withdrawals never paused In an emergency Pamo can pause new deposits, never withdrawals.	Built on open standards USDC on Arc and standard ERC-4626 lending vaults, verifiable on the Arc explorer.

Built on Arc

LAYER	WHAT PAMO USES
Blockchain	Arc mainnet: Circle's Layer-1 where USDC is the native currency and gas, with sub-second, final settlement
Money	USDC on Arc (0x3600...0000)
Savings contract	PamoSavings: one Solidity contract holding every pot and its rules
Yield	Curated Morpho lending vaults on Arc (ERC-4626)
Live rates & previews	Circle's Arc App Kit, Earn module (vault discovery, rates, fees, quotes)
Web app	Next.js with wagmi and viem

What "it works" looks like

- ☐ The Pamo contract is deployed and verified on Arc mainnet, with a public code repository.
- ☐ A new user connects a wallet, opens an Anytime Vault, saves 1 USDC, sees its value and withdraws it on mainnet in under two minutes.
- ☐ A Goal Vault refuses an early withdrawal and unlocks once its target is reached.
- ☐ Calm, Steady and Bold show live rates from three real Arc lending vaults, and each saves into its own vault.
- ☐ The Growth Calculator works without a wallet and its numbers check out.
- ☐ Every save and withdrawal shows a review whose numbers match the result.
- ☐ Tests prove no admin can move user funds and that withdrawals work even when deposits are paused.
- ☐ The app is live at a public URL and works on a phone.
