

# Pamó

Keep it safe.

Pamo is a save-and-earn app. People save in USDC, set goals, and their savings earn live lending yield while they sit, without ever handing over control of their money.

| Currently live on Arc. Multichain support is on the roadmap.

| PLATFORM             | CURRENCY | BUILT FOR       | STATUS      |
|----------------------|----------|-----------------|-------------|
| Web app              | USDC     | Everyday savers | v1 in build |
| Mobile app (roadmap) |          |                 |             |

# What Pamo is

Pamo turns idle USDC into savings that grow. You open a savings pot, choose how much risk you're comfortable with, and put money in. Pamo places it in a curated onchain lending vault, where borrowers pay interest. Your balance grows over time, and you can see exactly what you've saved and what you've earned.

Some savings you want to reach any time; some you want to protect until a goal is met. Pamo supports both. Everything happens onchain in USDC: Pamo never holds your keys, and no one but you can withdraw your savings.

The name comes from the Yoruba *fi pamọ*, meaning "keep it safe."

|                                                                                                                                                                                                                          |                                                                                                                                                                         |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>THE PROBLEM</b><br>Most USDC sits idle, earning nothing. Earning yield onchain usually means finding vaults, reading contract addresses and learning DeFi jargon. That's too much for someone who just wants to save. | <b>THE ANSWER</b><br>Save any amount in a few taps, set goals, compare risk in plain language, and earn live yield, with honest numbers and full control of your money. |
| <b>WHO IT'S FOR</b><br>People who hold USDC, or want dollar savings, and want it to grow without being DeFi experts.                                                                                                     | <b>CORE USE CASE</b><br>"I have 200 USDC. I want some I can reach any time, and a 1,000 USDC goal by December, both earning while I wait."                              |

# From wallet to interest and back

Interest grows the value of your savings → you withdraw USDC plus what it earned.

|                      |                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Pot</b>           | One savings bucket that belongs to you. Every Anytime Vault and Goal Vault is a pot.                          |
| <b>Tier</b>          | Calm, Steady or Bold. It decides which curated lending vault your pot's money goes into.                      |
| <b>Lending vault</b> | An onchain vault that lends USDC to borrowers and earns interest. Run by a professional curator, not by Pamo. |
| <b>APY</b>           | The vault's yearly rate <i>today</i> , after vault fees. Live, so it changes daily.                           |
| <b>Earned</b>        | What your pot is worth now, minus what you put in.                                                            |

# In build: version 1

**IN BUILD**

part of v1, shipping on mainnet

**ROADMAP**

planned after v1 (section 04)

## F1 Anytime Vault

**IN BUILD**

Savings you can reach whenever you want. Add money any time, take out part or all of it any time, and watch it earn in between.

- Open with a tier and a first deposit; top up whenever.
- Withdrawals only ever go back to you.

## F2 Goal Vault

**IN BUILD**

Savings with a purpose. Name your goal, set a target amount and an unlock date, and Pamo keeps the money protected until you get there.

- Unlocks when your balance reaches the target **or** the unlock date arrives, whichever comes first.
- A progress bar shows how close you are; add money any time.

## F3 Pamo Portfolios: Calm · Steady · Bold

**IN BUILD**

Choose how much risk you're comfortable with. Each tier puts your savings into one curated USDC lending vault, compared side by side with its live rate, its curator, how much cash is available to withdraw, and its risk in plain English.

- **Calm**: lowest risk, money easy to withdraw. **Steady**: balanced. **Bold**: higher potential rate, more risk.
- These are USDC lending vaults, not stocks or funds.

## F4 Growth Calculator

**IN BUILD**

See what your savings could grow to before you commit. Enter a starting amount, a monthly top-up and a number of months, pick a tier, and see the projected balance and growth curve at today's live rate.

- Works without a wallet. Always labelled "estimate at today's rate, not a promise."

#### F5 Review before you sign

IN BUILD

Every save and every withdrawal shows a clear summary before your wallet opens: the amount, where it goes, today's rate, any fees, the network fee in USDC, and any warnings, such as a vault being short on cash.

- No surprises: warnings appear before the button, not after a failure.

#### F6 Dashboard & pot details

IN BUILD

One screen with your total saved, what you've earned so far, and today's rate for each tier. Each pot shows its value, earnings and goal progress, with a full activity history linked to the block explorer.

#### F7 Wallet connection

IN BUILD

Connect a wallet in one step. If it's on the wrong network, Pamo offers a one-click switch to the right network and shows your USDC balance.

### 04 · WHAT'S NEXT

## Roadmap: after version 1

These features are designed but deliberately left out of v1, so the core saving experience is solid first.

#### R1 Pamo AI

ROADMAP

A savings assistant. A short risk quiz suggests the right tier; a goal written in plain English ("1,000 USDC for a laptop by March") becomes a savings plan. The AI suggests, you sign. It never holds keys.

#### R2 Pamo Business

ROADMAP

A treasury for teams and small businesses: shared savings with roles, approvals and a cash reserve.

### R3 Pamo Halal

ROADMAP

Savings for people who want to stay sharia-compliant. No interest: returns come from profit-sharing and certified halal sources, reviewed by a sharia advisory board, and kept fully separate from Pamo's lending vaults.

| FEATURE                      | WHAT IT WOULD DO                                                                                                             | WHY IT'S NOT IN V1                                                                                 | STATUS  |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|---------|
| <b>Pamo AI</b>               | Risk quiz → tier suggestion; plain-English goal → savings plan; the AI suggests, the user signs, and the AI never holds keys | Core saving must be solid first                                                                    | ROADMAP |
| <b>Pamo Business</b>         | Team treasury with roles, approvals and a cash reserve                                                                       | Needs a multi-user permissions design                                                              | ROADMAP |
| <b>Pamo Halal</b>            | Sharia-compliant savings: no interest, profit-sharing returns from certified halal sources                                   | v1 yield comes from interest-based lending; needs a compliant yield source and sharia board review | ROADMAP |
| <b>Auto-save</b>             | Recurring monthly deposits                                                                                                   | Needs a scheduler (keeper) to trigger the deposits                                                 | ROADMAP |
| <b>Blended portfolios</b>    | Each tier spread across several vaults with rebalancing                                                                      | Rebalancing logic is risky to rush                                                                 | ROADMAP |
| <b>Break a goal early</b>    | Withdraw a locked goal with a confirmation step                                                                              | Product decision pending                                                                           | ROADMAP |
| <b>Crosschain deposits</b>   | Save from other chains straight into Pamo                                                                                    | Adds bridge fees and extra flows                                                                   | ROADMAP |
| <b>Fiat onramp</b>           | Buy USDC inside Pamo                                                                                                         | Onramp providers cover only some regions                                                           | ROADMAP |
| <b>EURC savings</b>          | Save in euros                                                                                                                | USDC first                                                                                         | ROADMAP |
| <b>Gasless saving</b>        | Pamo pays the user's gas                                                                                                     | Needs a paymaster                                                                                  | ROADMAP |
| <b>Notifications</b>         | "Goal reached", "rate changed"                                                                                               | Needs a backend                                                                                    | ROADMAP |
| <b>Multichain</b>            | Run Pamo on more blockchains beyond Arc                                                                                      | Arc first, to get one chain right                                                                  | ROADMAP |
| <b>Mobile app</b>            | Native iOS and Android apps with all of Pamo's features                                                                      | Web app first; v1 already works in phone browsers                                                  | ROADMAP |
| <b>Passkey sign-in</b>       | Sign up with Face ID or a fingerprint. No wallet app, no seed phrase                                                         | Needs a smart-wallet provider confirmed on mainnet                                                 | ROADMAP |
| <b>Email or social login</b> | Sign in with email, Google or a one-time code, like any normal app                                                           | Needs an embedded-wallet provider                                                                  | ROADMAP |

| FEATURE                     | WHAT IT WOULD DO                                                                                             | WHY IT'S NOT IN V1                                                                                              | STATUS  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|---------|
| <b>One-tap saving</b>       | One confirmation instead of two ("Allow", then "Save")                                                       | Needs a smart wallet first                                                                                      | ROADMAP |
| <b>Account recovery</b>     | Lost phone? Get the account back without a seed phrase                                                       | Comes with passkey or email sign-in                                                                             | ROADMAP |
| <b>Cash out to bank</b>     | Turn savings back into money in a bank account                                                               | Needs an offramp provider and differs by region                                                                 | ROADMAP |
| <b>Your own currency</b>    | See balances as "≈ €110" next to USDC, so the numbers feel real (savings stay in USDC)                       | Needs a reliable price feed                                                                                     | ROADMAP |
| <b>Guided first save</b>    | A short walkthrough: what a pot is, what a tier means, then a first small deposit                            | Core flow first                                                                                                 | ROADMAP |
| <b>In-app help</b>          | Tap any term ("APY", "vault") for a one-line plain explanation                                               | Core flow first                                                                                                 | ROADMAP |
| <b>Tokenized treasuries</b> | Save into tokenized US government bonds onchain: a steady, low-risk return that fits "keep it safe"          | Access is limited today (often institutions only, with high minimums); needs a provider open to everyday savers | ROADMAP |
| <b>Pamo Markets</b>         | Invest in tokenized stocks alongside savings, kept clearly separate from savings and labelled as higher risk | Needs securities licences, identity checks and approval country by country; comes after tokenized treasuries    | ROADMAP |

## 05 · PRINCIPLES

# What Pamo always does

|                                                                                                                               |                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>Your money stays yours</b><br>Only you can withdraw your savings. No admin, including Pamo, can move, freeze or take them. | <b>Honest numbers</b><br>Rates are live and shown as they are, even when low. Projections are always called estimates. |
| <b>No surprises</b><br>Every money movement is reviewed before you sign, with warnings shown first.                           | <b>Plain language</b><br>"Lending vault", "earned", "unlocks on". No unexplained jargon.                               |
| <b>Withdrawals never paused</b><br>In an emergency Pamo can pause new deposits, never withdrawals.                            | <b>Built on open standards</b><br>USDC and standard ERC-4626 lending vaults, verifiable on the block explorer.         |

## How it's built

| LAYER                 | WHAT PAMO USES                                                     |
|-----------------------|--------------------------------------------------------------------|
| Blockchain            | A public, EVM-compatible blockchain with fast, final settlement    |
| Money                 | USDC, Circle's dollar stablecoin                                   |
| Savings contract      | PamoSavings: one Solidity contract holding every pot and its rules |
| Yield                 | Curated USDC lending vaults (ERC-4626 standard)                    |
| Live rates & previews | Vault data service for discovery, live rates, fees and quotes      |
| Web app               | Next.js with wagmi and viem                                        |

## What "it works" looks like

- ☐ The Pamo contract is deployed and verified on mainnet, with a public code repository.
- ☐ A new user connects a wallet, opens an Anytime Vault, saves 1 USDC, sees its value and withdraws it on mainnet in under two minutes.
- ☐ A Goal Vault refuses an early withdrawal and unlocks once its target is reached.
- ☐ Calm, Steady and Bold show live rates from three real lending vaults, and each saves into its own vault.
- ☐ The Growth Calculator works without a wallet and its numbers check out.
- ☐ Every save and withdrawal shows a review whose numbers match the result.
- ☐ Tests prove no admin can move user funds and that withdrawals work even when deposits are paused.
- ☐ The app is live at a public URL and works on a phone.
